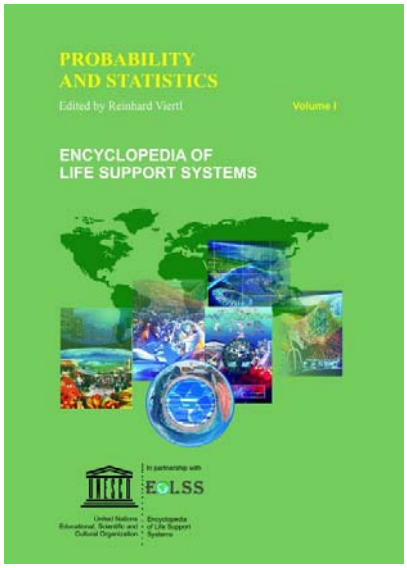
# CONTENTS

## PROBABILITY AND STATISTICS



**Probability and Statistics - Volume 1**
**No. of Pages:** 406
**ISBN:** 978-1-84826-052-8 (eBook)
**ISBN**: 978-1-84826-502-8 (Print Volume**)**

**Probability and Statistics - Volume 2**
**No. of Pages:** 520
**ISBN:** 978-1-84826-053-5 (eBook)
**ISBN**: 978-1-84826-503-5 (Print Volume**)**

**Probability and Statistics - Volume 3**
**No. of Pages:** 280
**ISBN:** 978-1-84826-054-2 (eBook)
**ISBN**: 978-1-84826-504-2 (Print Volume**)**

# CONTENTS

## VOLUME I

**Probability and Statistics** **1**
Reinhard Viertl,*Institute of Statistics and Probability Theory, Vienna University of Technology, Vienna, Austria*

1. Introduction
2. Origin and History
3. Probability
   - 3.1. Continuous Probability Distributions
   - 3.2. Discrete Probability Distributions
   - 3.3. Mixed Probability Distributions
   - 3.4. Mixture Distributions
4. Descriptive Statistics
   - 4.1. Empirical Distributions
   - 4.2. Empirical Distribution Function
   - 4.3. Multivariate Data
   - 4.4. Regression
   - 4.5. Indices
   - 4.6. Time Series
5. Stochastic Models
   - 5.1. Stochastic Vectors
     - 5.1.1. Discrete Stochastic Vectors
     - 5.1.2. Continuous Stochastic Vectors
   - 5.2. Correlation and Independence of Stochastic Quantities
   - 5.3. Conditional Distributions
6. Sequences of Stochastic Quantities
   - 6.1. The Law of Large Numbers
   - 6.2. Central Limit Theorem
7. Stochastic Processes
8. From Stochastic Models to Statistical Inference
9. Classical Statistical Inference
   - 9.1. Point Estimates for Parameters and Other Characteristic Values of Probability Distributions
   - 9.2. The Fundamental Theorem of Statistics
   - 9.3. Further Methods in Classical Statistical Inference
10. Bayesian Statistical Inference
11. Information and Decision
12. Types of Uncertainty and Data Quality
13. Outlook

**Probability Theory** **41**
Teugels J. L.,*University Center for Statistics, Catholic University of Leuven, Belgium*

1. Introduction: Chance Mechanisms
   - 1.1. Divination
   - 1.2. Dispute Solving
   - 1.3. Games
   - 1.4. Gambling
   - 1.5. Scientific Evidence
2. Early Concepts of Probability
   - 2.1. Ancient Times
   - 2.2. Renaissance
   - 2.3. The Problem of Points
   - 2.4. Other Problems from Gambling

3. The First Steps Towards a Theory of Probability
   3.1. New Contributions
   3.2. Still More Gambling Problems
   3.3. Theoretical Contributions
4. Earliest Applications
   4.1. Insurance
   4.2. Demography
   4.3. The Theory of Errors
   4.4. Social Sciences
   4.5. Geometry
5. The Axiomatization of Probability Theory
   5.1. Doubts about Probability Theory
   5.2. The Need for Axiomatization
   5.3. The Russian School
6. Probability and Statistics in Life Support Systems
   6.1. Spatial Statistics
   6.2. Time Series
   6.3. Image Analysis
   6.4. Simulation
7. Water
   7.1. Rainfall
   7.2. Water Storage
   7.3. Floods
   7.4. Environmental Issues
   7.5. Seawater
8. Energy
   8.1. Stochastic Hydrology
   8.2. Wind
   8.3. Reliability Theory
9. Environment
   9.1. Wildlife Sampling
   9.2. Abundance
   9.3. Forestry
   9.4. System Analysis
   9.5. Exposure Data
   9.6. Environment and Health
10. Food
11. Agriculture
   11.1. Design and Analysis of Experiments
   11.2. Weather Modification

**Mathematical Foundations and Interpretations of Probability** **68**
Wiebe R. Pestman,*University of Utrecht, the Netherlands*

1. Introduction
2. Finite Probability Spaces
3. Conditional Probability
4. Discrete Probability Spaces
5. Kolmogorov Triplets

**Random Variables and Their Distributions** **88**
Wiebe R. Pestman,*Centre for Biostatistics, University of Utrecht, Holland*

1. Introduction
2. The distribution function of a random variable.
3. Classification of random variables.

4. Some special discrete probability distributions.
5. Some special continuous probability distributions.
6. Location characteristics of a real-valued random variable.
7. Dispersion characteristics of a real-valued random variable.
8. Joint distribution functions.
9. Independence of Random Variables
10. Random Variables in Statistics
11. The moments and the characteristic function of a random variable.
12. Conditional probability distributions
13. Probability Distributions Presented as Borel Measures

**Limit Theorems of Probability Theory** **123**
G.Christoph,*Department of Mathematics, Otto-von-Guericke-University of Magdeburg, Germany*

1. Introduction and Preliminaries
   1.1. Sequences of Events and Their Probabilities
   1.2. Inequalities for Sums of Random Variables
   1.3. Modes of Convergence
2. Laws of Large Numbers
   2.1. Weak Laws of Large Numbers
   2.2. Strong Laws of Large Numbers
   2.3. An Application, the Glivenko-Cantelli Theorem
   2.4. The Law of Iterated Logarithm
3. Central Limit Theorem
   3.1. Moivre-Laplace Central Limit Theorem
   3.2. Lindeberg-Lévy and Lindeberg-Feller Central Limit Theorems
   3.3. Error Bounds and Asymptotic Expansions in Central Limit Theorem
   3.4. Multivariate Central Limit Theorem
4. Limit Theorems of Large Deviations
5. Classical Summation Theory
6. Local Limit Theorems
   6.1. Approximation by the Density of the Normal Law
   6.2. Approximation by Poisson Probabilities
7. Limit Theorems for Extreme Values

**Alternative Probabilistic Systems** **156**
Kurt Weichselberger,*Munich, Germany*

1. Introduction
2. Early developments
3. Capacities
4. The 1970s and 80s
5. From the 1990s on

**Stochastic Processes and Random Fields** **172**
K. Grill,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Wien, Austria*

1. Introduction
   1.1. Basic Notions and Definitions
2. Important Concepts and Methods
   2.1. Dependency
   2.2. Correlation Theory
   2.3. Convergence
3. Types of Stochastic Processes
   3.1. Gaussian Process

3.2. Independent Increment Processes and Martingales
3.3. Markov Processes and Stochastic Differential Equations
3.4. Stationary Processes
3.5. Self-similar (Fractal) Process
3.6. Point Process
3.7. Empirical Processes
3.8. Processes in Random Environment
4. Random Fields
4.1. Basic Facts
4.2. Gaussian Random Fields
4.3. Gibbs Random Fields

**Construction of Random Functions and Path Properties** **199**
P. Révész,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Wien, Austria*

1. Examples
1.1. Poisson Process
1.2. Markov Chain
1.3. Martingale
1.4. Brownian Motion
2. Definition of the Stochastic Process
3. Poisson Process
3.1. The Distribution
3.2. A Construction of the Poisson Process
3.3. Generalizations
4. Brownian Motion
4.1. Random Walk
4.2. Distributions
4.3. Path Properties
4.4. Local Time
4.5. Fourier Series Representation

**Markov Processes** **214**
K. Grill,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Wien, Austria*

1. Introduction
1.1. The Markov Property and the Tansition Function
2. Discrete Markov Chains
2.1. Classification of the State of a Markov Chain
2.2. Recurrence
2.3. Transient States
3. Continuous Time Markov Chains
4. Examples of Markov Chains
4.1. Simple Random Walk
4.2. Birth and Death Processes
4.3. Galton-Watson Processes
5. Stopping Times and the Strong Markov Property
6. Path Properties and Continuity
7. Transition Operators
7.1. Definition and Basic Properties
7.2. The Infinitesimal Operator
7.3. The Resolvent
7.4. Path Properties and the Infinitesimal Operator
8. Examples of Markov Processes

**Stochastic Calculus** **247**
Révész P,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Vienna, Austria*

1. Stochastic Integral
2. Ito Formula
3. Tanaka Formula
4. Differential of the Brownian Motion

**Stochastic Differential Equations** **252**
Pal Revesz, *Institut für Statistik und Wahrscheinlichkeitstheorie, Vienna University of Technology, Austria*

1. Existence and Unicity
2. A Stochastic Chain Rule
3. A Property of the Solution of a Stochastic Differential Equation

**Stationary Processes** **256**
K.Grill,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Wien, Austria*

1. Introduction
2. Spaces and operators related to stationary processes
   2.1. Spaces of square-integrable functions
   2.2. Shift operators
3. The correlation function
4. Spectral representations
5. Prediction
   5.1. Basic facts about prediction
   5.2. Singularity and regularity
   5.3. The best linear prediction for weakly stationary sequences

**Ergodic Properties of Stationary, Markov, and Regenerative Processes** **279**
Karl Grill,*Institut für Statistik und Wahrscheinlichkeitstheorie, TU Wien, Austria*

1. Introduction
2. Ergodic Theory for Stationary Processes
   2.1. The Mean Square Ergodic Theorem
   2.2. The Strong Ergodic Theorem
3. Ergodic Properties of Markov Processes
   3.1. Irreducible Markov Chains
4. Regenerative Processes
   4.1. Definition
   4.2. Examples of Regenerative Processes.
   4.3. Ergodic Theorems for Regenerative Processes
5. Applications of Ergodic Theorems
   5.1. Statistical Inference for Markov Chains
   5.2. The Range of a Random Walk
   5.3. Entropy

**Homogeneous Random Fields and Their Evaluation** **302**
V.A. Gordin,*Hydrometeorological Centre of Russia & Mathematical College of Independent Moscow University,Russia*

1. Introduction
2. Homogenous random fields and their spectral representation

3. Meteorological applications.
4. Approximation and positive definiteness of correlation functions.
5. Perturbation theory for improvement of positive definiteness
6. Computational algorithm
   6.1. Errors of Sample Correlation Coefficients
   6.2. Approximation of Correlations
   6.3. Corrections of Matrix Coefficients
   6.4. Deviations to Scale Multipliers along Horizontal Direction
   6.5. Separation of the CF for "true" Meteorological Parameters and Observation Errors
7. Results
8. Conclusion

**Index** **341**

**About EOLSS** **349**

# VOLUME II

**Probabilistic Models and Methods** **1**
Masaaki Kijima,*Graduate School of Economics, Kyoto University,Japan*

1. Introduction
2. A Simple Probabilistic Model
3. Risk Management
4. Independence
5. Stochastic Processes
6. Processes with Independent Increments
   6.1. Poisson Processes
   6.2. Brownian Motion
7. Markov Processes
   7.1. Markov Chains
   7.2. Diffusion Processes
8. Stochastic Differential Equations
9. Martingales

**Statistical Simulation and Numerical Procedures** **28**
Ion Văduva,*University of Bucharest, Romania*

1. Introduction
2. Random Number Generation
   2.1. Linear Congruential Generators
   2.2. Other Sources of Uniform Random Numbers
3. Non Uniform Random Variate Generation
   3.1. General Methods
      3.1.1. The Inverse Method
      3.1.2. The Composition (Mixture) Method
      3.1.3. The Acceptance-Rejection Method
   3.2. Other Methods
      3.2.1. Ratio-of-uniform Method
      3.2.2. Simulation of some Particular Distributions
      3.2.3. Simulation of Some Multivariate Distributions
4. The Use of Simulation in Statistics
   4.1. Estimation of Parameters via Simulation
   4.2. Use of Simulation in Hypotheses Testing
   4.3. The Bootstrap Technique

5. Use of Simulation in Numerical Calculation
5.1. Generalities on the Monte Carlo Method
5.2. Evaluating an Integral
5.2.1. Crude Monte Carlo
5.3. Variance Reduction Techniques
5.3.1. Importance Sampling
5.3.2. Antithetic Variates
5.3.3. Control Variates
5.4. Solving Operatorial Equations
5.4.1. Solving Systems of Linear Equations
5.4.2. Solving Integral Equations
5.5. Monte Carlo Optimization
5.6. Markov Chain Monte Carlo

**Insurance Mathematics** **62**
Bjørn Sundt,*Vital Forsikring ASA, Norway*

1. Introduction
2. Non-life Insurance
2.1. Premium Principles
2.2. Credibility Theory
2.3. Bonus Systems
2.4. Collective Risk Theory
2.5. Reserves
2.6. Aggregate Claims Distributions
2.7. The Stop Loss Transform
3. Life Insurance
3.1. Introduction
3.2. The Single Life Model
3.3. Spouse Pension
3.4. Second Order Basis

**Mathematical Models in Finance** **83**
P. Embrechts,*Department of Mathematics, ETH Zürich, Switzerland*
T. Mikosch,*Institute of Mathematical Sciences, University of Copenhagen, Denmark*

1. A Tutorial on Mathematical Finance without Formulae
2. The Pricing of Financial Derivatives by Mathematical Means
2.1. The Approach by Black, Scholes, and Merton
2.2. Pricing by Change of Measure
3. Interest Rate Models
4. Financial Time Series Models

**Reliability and Maintainability** **100**
R. E. Barlow,*Professor*, *University of California at Berkeley*, *California*, *USA*
M. Xie,*Associate Professor*, *National University of Singapore*, *Singapore*

1. Introduction
2. Some Reliability Concepts
2.1. Commonly Used Reliability Measures
2.2. Some Lifetime Distribution Models
3. System Reliability
3.1. Coherent Systems
3.2. Methods for System Reliability Calculation
3.3. System Reliability Bounds and Approximations

4. Availability and Maintainability
5. Reliability Data Analysis
   5.1. Graphical Techniques for the Analysis of Failure Data
   5.2. Statistical Estimation for the Exponential Distribution
   5.3. Repairable System Reliability Analysis
6. Towards the 21st Century

**Inventories, Water Storage and Queues** **120**
N.U. Prabhu,*School of Operations Research and Industrial Engineering, Cornell University, USA*

1. Introduction
2. Inventory Models
   2.1. The (*Q, r*) Model and the EOQ Formula
   2.2. The Newsvendor Problem
   2.3. The (*s, S*) Inventory Model
   2.4. A Periodic Review Base Stock Inventory Model
3. Models for Water Storage
   3.1. Moran's Model for the Finite Dam
   3.2. A Continuous Time Model for the Dam
4. Queueing System GI /G /S
   4.1. The Queueing System M/M/S; Erlang's Loss Formulas
   4.2. The M/G/1 System; The Pollaczek-Khintchine Formula
5. Queueing Networks
   5.1. Closed Networks
   5.2. Open Networks: The Product Formula
   5.3. Jackson Networks
   5.4. A Closed Network Model for Flexible Manufacturing Systems
   5.5. An Open Network Model for Flexible Manufacturing Systems

**Information Theory and Communication** **143**
Tibor Nemetz,*Rényi Mathematical Institute, Hungarian Academy of Sciences, Budapest, Hungary*

1. Introduction
   1.1. The Origins
   1.2. Shannon Theory
   1.3. Future in Present
2. Information source
3. Source coding
   3.1. Uniquely Decodable Codes
   3.2. Entropy
   3.3. Source Coding with Small Decoding Error Probability
   3.4. Universal Codes
   3.5. Facsimile Coding
   3.6. Electronic Correspondence
4. Measures of information
5. Transmission channel
   5.1. Classification of Channels
   5.2. The Noisy Channel Coding Problem
   5.3. Error Detecting and Correcting Codes
6. The practice of classical telecommunication
   6.1. Analog-to-Digital Conversion
   6.2. Quantization
   6.3. Modulation
   6.4. Multiplexing
   6.5. Multiple Access
7. Mobile communication

8. Cryptology
8.1. Classical Cryptography
8.1.1. Simple Substitution
8.1.2. Transposition
8.1.3. Polyalphabetic Methods
8.1.4. One Time Pad
8.1.5. DES: Data Encryption Standard. AES: Advanced Encryption Standard
8.1.6. Vocoders
8.2. Public Key Cryptography
8.2.1. Public Key Crypto-algorithms
8.2.2. Proving Integrity: Hashing
8.2.3. Cryptographic Protocols
8.3. Cryptanalysis

**Foundations of Statistics** **170**
Reinhard Viertl,*Vienna University of Technology, A-1040 Wien, Austria*

1. Introduction
2. Statistical data
3. Uncertainty
4. Probability and philosophical foundations
4.1. Classical Probabilities
4.2. Geometric Probabilities
4.3. Probabilities as Idealized Relative Frequencies
4.4. Probability Spaces
4.5. General Axiomatic Probability
4.6. Subjective Probabilities
4.7. Transition Probabilities
4.8. Fuzzy Probability Densities
4.9. Philosophical Questions
5. Statistical populations and samples
5.1. Statistics and Sample Moments
5.2. Sample Mean
6. Sampling from the normal distribution
6.1. The Chi-square Distribution
6.2. Gosset's *t*-distribution
6.3. *F*-distribution
7. Confidence statements and statistical tests
8. A-priori information
8.1. *A-priori* Knowledge
8.2. *A-priori* Distributions
9. Sensitivity and robustness
9.1. Model Robustness
9.2. Data Robustness
9.3. Bayesian Robustness
10. Information and decisions

**Preliminary Data Analysis** **202**
Werner Gurker, *Vienna University of Technology, Wien, Austria*
Reinhard Viertl,*Vienna University of Technology, Wien, Austria*

1. Univariate Data Sets
1.1. Graphical Displays
1.1.1. Frequencies
1.1.2. Cumulative Frequencies
1.2. Measures of Location

1.3. Depths
1.4. Measures of Spread
1.5. Outliers
1.6. Seven-point summaries
1.7. Box-Plots
1.8. Data Transformation
1.9. Probability Plots
1.9.1. P-P-Plots
1.9.2. Q-Q-Plots
2. Bivariate Data Sets
2.1. Graphical Displays
2.2. Numerical Characteristics
2.3. Regression
3. Multivariate Data Sets
3.1. Data Matrix and Summary Statistics
3.2. Data Transformations
3.3. Graphical Displays
4. Concluding Remarks

**Statistical Inference** **251**
Reinhard Viertl,*Institute of Statistics and Probability Theory, Vienna University of Technology, Austria.*

1. Introduction
2. Parametric and Nonparametric Inference
2.1. Parametric Inference
2.2. Nonparametric Inference
2.3. Semiparametric Inference
3. Sufficiency and Information
3.1. The Likelihood Function
4. Classical Statistical Inference
4.1. Point Estimators
4.2. Confidence Regions
4.3. Testing Statistical Hypotheses
5. Bayesian Inference
5.1. Sufficiency
5.2. Conjugate Families of Distributions
6. Data Quality and Statistical Inference
7. Statistical Inference and Decisions
7.1. Selection of Stochastic Models
7.2. Parameter Estimation as a Decision Process
7.3. Statistical Tests as Decisions
7.4. General Decisions Subject to Loss
7.5. Decisions in the Case of Fuzzy Data
8. Conclusion

**Statistical Parameter Estimation** **277**
Werner Gurker, *Vienna University of Technology, Wien, Austria*
Reinhard Viertl,*Vienna University of Technology, Wien, Austria*

1. Fundamental Concepts
1.1. Parameter and Estimator
1.2. Mean Squared Error
1.3. Loss and Risk
1.4. Sufficient Statistic
1.5. Likelihood Function
1.6. Distributional Classes

1.6.1. (Log-) Location-Scale-Families
1.6.2. Exponential Family
2. Optimality Properties
2.1. Unbiasedness
2.2. Consistency
2.3. Admissibility
2.4. Minimum Variance Bound
2.5. Minimum Variance Unbiased Estimation
2.5.1. The Theorem of Rao-Blackwell
2.5.2. The Theorem of Lehmann-Scheffé
2.6. Asymptotic Normality
3. Methods of Parameter Estimation
3.1. Method of Moments
3.2. Maximum Likelihood Estimation
3.3. Linear Estimation
3.3.1. Linear Models
3.4. Other Methods of Point Estimation
4. Classical Confidence Regions

**Statistical Testing of Hypotheses** **307**
Mikhail S. Nikulin,*Université Victor Bordeaux 2, France*

1. Introduction
2. Statistical Hypothesis
3. Statistical Test
4. Errors of the First and the Second Kind
5. The Power Function, the Power and the Significance Level of the Test
6. Non-randomized Test
7. Randomized Test
8. Unbiased Test
9. Uniformly Most Powerful Test
10. Neyman-Pearson Lemma
11. Consistency
12. Neyman Structure
13. Likelihood Ratio Test

**Robust Statistics** **326**
Filzmoser, P,*Vienna University of Technology, Austria*
Rousseeuw, P.J,*Universitaire Instelling Antwerpen, Belgium*

1. Motivation and Introduction
1.1. The Meaning of Robust Statistics
1.2. Outliers
1.3. Aims of Robust Statistics
1.4. History
2. Basic Concepts
3. The Breakdown Value
4. Positive-Breakdown Regression
5. Multivariate Location and Scatter
6. Regression Diagnostics
7. Other Robust Methods
8. The Maxbias Curve
9. Perspective and Future Directions

**Bayesian Statistics** **345**
José M. Bernardo,*Faculty of Mathematics, University of Valencia, Valencia, Spain*

1. Introduction
2. Foundations
   2.1. Probability as a Measure of Conditional Uncertainty
   2.2. Statistical Inference and Decision Theory
   2.3. Exchangeability and Representation Theorem
3. The Bayesian Paradigm
   3.1. The Learning Process
   3.2. Predictive Distributions
   3.3. Asymptotic Behavior
4. Inference Summaries
   4.1. Estimation
   4.2. Hypothesis Testing
5. Reference Analysis
   5.1. Reference Distributions
   5.2. Frequentist Properties
6. A Simplified Case Study
   6.1. Objective Bayesian Analysis
   6.2. Sensitivity analysis
7. Discussion and Further Issues
   7.1. Coherence
   7.2. Objectivity
   7.3. Applicability

**Statistical Inference with Imprecise Data** **408**
Reinhard Viertl,*Vienna University of Technology, Wien, Austria*

1. Imprecise data
2. Imprecise numbers and characterizing functions
   2.1. Special Imprecise Numbers
   2.2. Convex Hull of a Non-convex Pseudo-characterizing Function
3. Construction of characterizing functions
4. Multivariate data, imprecise vectors, and combination of imprecise samples
   4.1. Imprecise multivariate data and imprecise vectors
   4.2. Combination of Imprecise Observations
   4.3. Multivariate Data
5. Functions and imprecision
   5.1. Functions of Imprecise Variables
   5.2. Functions with Imprecise Values
6. Generalized inference procedures for imprecise samples
7. Classical statistical inference for imprecise data
   7.1. Generalized Point Estimators for Parameters
   7.2. Generalized Confidence Regions for Parameters
   7.3. Statistical Tests based on Imprecise Data
8. Bayesian inference for imprecise data
   8.1. Bayes' Theorem for Imprecise Data
   8.2. Bayes Estimators
   8.3. Generalized HPD-regions
   8.4. Fuzzy Predictive Distributions
   8.5. Fuzzy *a priori* Distributions
9. Conclusion

**Index** **447**

**About EOLSS** **459**

# VOLUME III

**Applied Statistics** **1**
Abdel H. El-Shaarawi,*National Water Research Institute, Burlington, Ontario, Canada L7R 4A6*

1. Introduction
2. Foundations
3. Exploratory Data Analysis
4. Models
5. Statistical Inference
6. Design of Experiments
7. The Future of Applied Statistics

**Correlation Analysis** **14**
V. Nollau,*Institute of Mathematical Stochastics, Technical University of Dresden, Germany*

1. Correlation Between Two Random Variables (Simple Correlation)
2. Partial Correlation
3. Multiple Correlation
4. Canonical Correlation

**Regression Analysis** **38**
V. Nollau,*Institute of Mathematical Stochastics, Technical University of Dresden, Germany*

1. Simple Regression
2. Multiple Regression
3. Gauß-Markov Theorem
4. Unequal Variances
5. Quasi-linear Regression
6. Multivariate Regression

**Analysis of Variance and Analysis of Covariance** **63**
V.Nollau,*Institute of Mathematical Stochastics, Technical University of Dresden, Germany*

1. Analysis of Variance (ANOVA)
   - 1.1. Fixed Models
     - 1.1.1. One-Way Classification
     - 1.1.2. Complete Higher-Way Classification
   - 1.2. Random (Effects) Models
     - 1.2.1. One-way Classification (with Unequal Numbers of Observations)
     - 1.2.2. Higher-way Classification
   - 1.3. Mixed (Effects) Models
2. Analysis of Covariance
   - 2.1. (1,1)-Classification of the analysis of covariance
   - 2.2. Mathematical model

**Sample Method and Quality Control** **95**
B.F. Arnold,*Institute for Statistics and Econometrics, University of Hamburg, Germany*
R. Gob,*Institute for Applied Mathematics and Statistics, University of Wurzburg, Germany*

1. Introduction: Quality Control and Statistical Quality Control
   - 1.1. Systematic Definition of Quality Control and Statistical Quality Control
   - 1.2. Historical Origins of Quality Control and Statistical Quality Control
   - 1.3. Contemporary Quality Control and Statistical Quality Control

2. Concepts of Quality
2.1. Item Quality Indicators
2.2. Lot Quality Indicators
2.3. Process Variation
2.4. Process Quality Indicators
2.5. Lots of Segments of Processes
2.6. Definition of Quality Levels
3. Inspection and Prevention in Quality Control
3.1. Inspection and Prevention in Product Quality Control
3.2. Inspection and Prevention in Process Quality Control
4. Decision Making and its Statistical Tools in Quality Control
4.1. The Decision Problem of Reactive Control
4.2. Decision Making by Sampling
4.3. Random Sampling and Statistical Hypothesis Testing
4.4. Interpretations of Acceptance and Rejection in Industrial Practice
4.4.1. Acceptance and Rejection in SLI
4.4.2. Acceptance and Rejection in SPI
4.5. Design Components of Statistical Decision Techniques in Quality Control
4.6. Economic Evaluation of SQC Decision Procedures
4.6.1. The Cost of Sampling
4.6.2. The Cost of Intervention
4.6.3. The Profit from Continuing Business
4.7. Economic Evaluation Indices
4.7.1. The Expected Value Approach
4.7.2. The Worst Case Approach
4.7.3. The Restricted Worst Case Approach
4.8. Statistical Evaluation of SQC Decision Procedures
4.9. Methods of Designing SQC Decision Procedures
4.9.1. Economic Design of SQC Decision Procedures
4.9.2. Statistical Design of SQC Decision Procedures
4.9.3. Mixed Economic-Statistical Design of SQC Decision Procedures
4.9.4. Acceptance of Designs by Industry
5. Statistical Lot Inspection Schemes
5.1. Classification of Sampling Plans by Decision Algorithm
5.1.1. Single Sampling Plans
5.1.2. Double Sampling Plans
5.1.3. Multiple Sampling Plans
5.1.4. Sequential Sampling Plans
5.1.5. Comparison of Decision Algorithms
5.2. Classification of Sampling Plans by Quality Model
5.2.1. Attributes Sampling for Lot Proportion Nonconforming
5.2.2. Attributes Sampling for Lot Average Number of Defects
5.2.3. Variables Sampling for Lot Mean
5.2.4. Variables Sampling for Lot Proportion Nonconforming
5.3. Special Acceptance Sampling Schemes
5.3.1. Dodge-Romig Plans
5.3.2. Prescription of Two Points of the OC Function
5.3.3. Military Standard
5.3.4. The $\alpha$ -Optimal Sampling Scheme
6. Statistical Process Inspection Schemes
6.1. The Time to Signal and the Run Length
6.2. Classification of Control Charts by Sampling Algorithm
6.3. Classification of Control Charts by Decision Algorithm
6.3.1. Shewhart Charts
6.3.2. Extended Shewhart Charts
6.3.3. Sequential Charts
6.3.4. Comparison of Decision Algorithms
6.4. Classification of Control Charts by Quality Model

6.4.1. Attributes Control Chart for Process Proportion Nonconforming
6.4.2. Attributes Control Charts for Process Average Number of Defects
6.4.3. Variables Control Charts for Process Mean
6.4.4. Variables Control Chart for Process Variance
6.5. Special Control Charts
6.5.1. Shewhart Charts with Prescribed Points of the OC Function
6.5.2. Control Charts in ISO Standards
6.5.3. Economic Design: Duncan's Approach
6.5.4. Economic Design: Von Collani's Approach
7. Recent Trends and Outlook

**Time Series Analysis** **137**
V.A.Gordin,*Hydrometeorological Centre of Russia & Mathematical College of Independent Moscow University,Russia*

1. Introduction
2. Finite-difference equations
2.1. Linear FDE
2.2. Boundary Value Problems
2.3. Non-linear FDE, that approximate, e.g., Lotka Volterra eq., Lorenz System
2.4. Lyapunov Exponents and their Evaluation
3. Interpolation, approximation, and checking
3.1. Polynomial and Trigonometric Interpolation
3.2. The Lebesgue Constant
3.3. Spline Interpolation
3.4. $\mathbf{1}^2$ – approximation
3.5. Wavelet Methods
3.6. Checking of Time Series
3.7. Chebyshev (Uniform) Approximation by Polynomials and Rational Functions
4. Correlations
4.1. Correlation Coefficient and Regression Method
4.2. Empirical Orthogonal Functions
4.3. Operators on Random Processes
5. Conclusion

**Statistical Experiments and Optimal Design** **186**
Andrej Pázman,*Comenius University, Bratislava, Slovakia*

1. Introduction
2. Linear models
3. How to measure the information obtained in an experiment modeled linearly
3.1. Information Matrices
3.2. Information Matrices for Parameter Subsets
3.3. Geometrical Presentation of the Information Contained in the Experiment
3.3.1. The Ellipsoid for Parameter Subsets
3.4. Optimality Criteria
4. The design of experiments with uncorrelated observations and non-restricted replications
4.1. The Set-up
4.2. The Equivalence Theorem - a Check of Optimality
4.3. The Elfving Set
4.4. A Quick Numerical Check of Information Properties of a Given Design
4.5. Numerical Computation of Φ-optimum Designs
4.6. Experiments with Constraints on Designs
5. Optimal design in linear models under a given covariance structure
6. Design of nonlinear regression experiments
6.1. The Model

6.2. The Optimal Design based on the Information Matrix
6.3. Other Measures of Information in Nonlinear Models
7. Perspectives and further developments
