HYDROLOGICAL SYSTEMS MODELING

Hydrological Systems Modeling - Volume 1

No. of Pages: 364

ISBN: 978-1-84826-198-3 (eBook)

ISBN: 978-1-84826-648-3 (Print Volume)

Hydrological Systems Modeling - Volume 2

No. of Pages: 332

ISBN: 978-1-84826-187-7 (eBook)

ISBN: 978-1-84826-637-7 (Print Volume)

CONTENTS

VOLUME I

Unsteady Flow On River Basin Slope and In The River Channels **1**
 Lev S. Kuchment, *Institute of Water Problems, Russian Academy of Sciences, Moscow, Russia*

1. Introduction
2. The Two-Dimensional Models of Overland Flow
3. The Equations of One-Dimensional Channel Flow
4. Simplification of the St. Venant Equations
5. Linearization of the St. Venant Equations and Solution of Linear Equations
6. Kinematic Wave Equations and Their Application
7. Numerical Solution of the Unsteady Flow Equations
8. Application of Finite Elements Methods
9. Lumped Linear Models of Routing in the River Basin
10. Lumped Linear Time Invariant Models of Routing
11. General Approach to Determining of the Unit Impulse Response
12. Nonlinear Lumped Hydrological Systems
13. Conclusions

Modeling Of Processes Of Snow Cover Formation And Snowmelt **45**
 Lev S. Kuchment, *Institute of Water Problems, Russian Academy of Sciences, Moscow, Russia*

1. Introduction
2. Modeling of Hydrothermal Processes in the Dry Snow Pack
3. Heat and Water Transfer in Melting Snow Cover
4. Snowmelt
 - 4.1. Short-Wave Radiation
 - 4.2. Incoming Long Wave Radiation
 - 4.3. Outgoing Long Wave Radiation
 - 4.4. Turbulent Exchange
 - 4.5. The Heat Flux at the Ground Surface
5. Spatial Variability of Snow Cover
6. Conclusion

Models of Vertical Energy and Water Transfer within the “Soil -Vegetation -Atmosphere” System **68**

Yeugeniy Mikhailovich Gusev, *Water Problems Institute, Russian Academy of Science, Moscow, Russia*
 O.N. Nasonova, *Water Problems Institute, Russian Academy of Science, Moscow, Russia*

1. Soil-Vegetation/snow cover- Atmosphere System (SVAS)
2. Energy and water exchange in SVAS
 - 2.1. Energy Transfer and Conversion in SVAS
 - 2.2. Vertical Water Exchange in SVAS
 - 2.3. Soil Water Movement
3. Physically based modeling of energy and water transfer in SVAS
 - 3.1. Soil – Vegetation – Atmosphere - Transfer (SVAT) Models
 - 3.2. Input Data for SVAT Models
 - 3.3. Output Variables of SVAT Models
4. Spatial heterogeneity
5. Validation of SVAT models
 - 5.1. Local Validation
 - 5.2. Basin-scale and Large-scale Validation
6. Intercomparison of SVAT models simulations

Longterm Forecasting Of Snowmelt Runoff**102**Burakov D.A, *Krasnoyarsk Centre of Hydrometeorology and Environmental Monitoring, Krasnoyarsk, Russia*

1. Background Information
2. Statistical Methods Used in Forecast
3. The Physical-statistical Water Balance Method
 - 3.1. Equation for Snowmelt Runoff
 - 3.2. A Rough Calculation of Evaporation and Infiltration
 - 3.3. Calculation of Melt of Frozen Soil
4. Long-Term Forecasts of the Volume of the Spring Flood
 - 4.1. Input Data
 - 4.2. Development of the Dependences for the Long-Term Forecasting of the Volume of the Spring Flood
5. Long-Term Forecast of Maximum Water Discharges
6. Long-Term Forecasts of the Spring Flooding Based on Mathematical Models of Process of its Build Up
 - 6.1. General Structure of Models
 - 6.2. Calculation of the Water Yield of the River Basin and Water Inflow of the River Network
 - 6.3. Use of Satellite Information to Assess the Dynamic of Snow Cover of the River Basin
 - 6.4. Travel Time Curves and Calculation of the Water Discharge (Water Levels) in the Outlet Gauge
7. Conclusions

Numerical Modeling Of Ice Regime In Rivers**137**E. I. Debolskaya, *Water Problems Institute, Russian Academy of Science, Moscow, Russia*

1. Introduction
2. Ice Jams
3. One-dimensional Modeling
 - 3.1. 1-D Models of Ice Regime in Rivers
 - 3.2. 1-D Model of Ice Jam
 - 3.3. Model of Bed Deformation in Under-ice Rivers
4. Two-dimensional Modeling
 - 4.1. 2-D Models of Ice Regime in Rivers
 - 4.2. 2-D Model of Ice Jam
 - 4.3. 2-D model of the Pollutant Propagation under Ice Jam Condition
5. Numerical Modeling the Turbulent Structure of Flows Under Ice
6. Conclusions

Mathematical Modeling of Flow in Watersheds and Rivers**167**Vijay P. Singh, *Louisiana State University, Department of Civil and Environmental Engineering Baton Rouge, LA 70803-6405, USA*

1. Introduction
2. Flow in Watersheds and Channels
3. Governing Equations
 - 3.1. Surface Flow
 - 3.2. Unsaturated Flow
 - 3.3. Saturated Flow
 - 3.4. Initial and Boundary Conditions
4. Deterministic and Statistical Flow Modeling
5. Deterministic Modeling of Flow in Watersheds
 - 5.1. Infiltration and Soil Moisture
 - 5.2. Storm Runoff Generation
 - 5.3. Surface Runoff
 - 5.3.1. Surface Runoff Hydrograph

- 5.3.2. Surface Runoff Volume
- 5.4. Hydrologic Data
- 6. Deterministic Modeling of Flow in Channels
 - 6.1. Geometric Representation
 - 6.2. Governing Equations
 - 6.3. Sources and Sinks
 - 6.4. Initial and Boundary Conditions
 - 6.5. Simplifications of Governing Equations
 - 6.6. Applicability of Simplified Representations
 - 6.7. Solution of St. Venant Equations
 - 6.8. Data Acquisition
- 7. Statistical Modeling of Flow in Watersheds
 - 7.1. Empirical Analyses
 - 7.2. Phenomenological Analyses
 - 7.3. Stochastic Analyses
- 8. Emerging Technologies for Flow Modeling
 - 8.1. Artificial Neural Networks
 - 8.2. Fuzzy Logic
 - 8.3. Genetic Algorithms
 - 8.4. Combination Methods
- 9. Uncertainty Analysis
 - 9.1. Univariate Distributions from Impulse Response Functions
 - 9.2. Entropy-Based Univariate Probability Distributions
 - 9.3. Joint Probability Distributions
 - 9.4. Point Estimation Methods
 - 9.4.1. Rosenblueth's Method
 - 9.4.2. Harr's Method
 - 9.4.3. Li's Method
 - 9.4.4. Modified Rosenblueth's Method
 - 9.4.5. Characteristics of Point Estimation Methods
- 10. Hydrologic Design

Mathematical Models for Water Resources Management

206

V. G. Priazhinskaya, *Laboratory of Water Resources Management, Water Problems Institute of the Russian Academy of Sciences, Russia*

- 1. Introduction
- 2. Mathematical modeling in water resources planning
 - 2.1. Total state
 - 2.2. Classes of models of water resources planning and management
 - 2.3. Optimization models
 - 2.3.1. Deterministic river basin modeling
 - 2.3.2. Water flow model
 - 2.3.3. Stochastic dynamic programming reservoir operating model
 - 2.3.4. Probability distributions of storage volumes and releases
 - 2.4. The water resources system simulation model
- 3. Models of regional agricultural development, location and water use with regard to non-point source pollution
- 4. Water resources management in the face of climatic/ hydrological uncertainties
 - 4.1. Role of general circulation models in water resources management
 - 4.2. Mathematical modeling of water demand
- 5. Water quality management
 - 5.1. Main problems and criteria of water quality
 - 5.2. Water quality modeling
 - 5.3. Mathematical model of water quality improvement
- 6. Global model of decision-making support system functioning
- 7. Conclusions

Mathematical Models of Soil Irrigation and Salting **255**
 L.V.Kireycheva, *All-Russian Research Institute of Hydraulic Engineering and Land Reclamation, Russia*

1. Introduction
2. Balance models of calculation of the irrigation regime and crops productivity.
 - 2.1. The calculation of actual time and water delivery
 - 2.2. Water and salt balance calculation under slow drainage
 - 2.3. “Soil-water-crop-atmosphere” water exchange and crop species in modeling
 - 2.4. The calculation of scheduling program for sprinkler irrigation
 - 2.5. Water stress influence on crop yield at different phenological phases in irrigation scheduling
3. Simulation of water and salts transport in unsaturated-saturated soils.
 - 3.1. Vertical water transport in drainage and subsurface irrigation
 - 3.2. The one-dimensional model of vertical water salt transport
 - 3.3. One-dimensional model of salute transport in unsaturated-saturated zone. Estimation of ion exchange and sorption
 - 3.4. The estimation models for the influence of salinity on ground water quality and crop yield
4. The complex simulation models
 - 4.1. Simulation of water flow, solute transport and plant growth in the “soil-water-atmosphere-plant-environment”
5. Conclusion

Index **303**

About EOLSS **309**

VOLUME II

Modeling Of Water Erosion And Sediment Transport **1**
 V.N. Demidov, *Water Problems Institute of Russian Academy of Sciences, Moscow, Russia*

1. Introduction
2. Structure of the Model
 - 2.1. Modeling Rainfall Runoff Formation
 - 2.2. Modeling Soil Erosion and Sediment Transport in the River Basin
3. Model Application
4. Conclusion

Water Quality Modelling In Mesoscale And Large River Basins **11**
 Valentina Krysanova, Fred Hattermann, Shaochun Huang, and Cornelia Hesse
Potsdam Institute for Climate Impact Research, P.O. Box 601203, Telegrafenberg, 14412 Potsdam, Germany
 Anja Voß, *Center for Environmental Systems Research, University Kassel, Kurt-Wolters-Str., 34109 Kassel, Germany*

1. Introduction
 - 1.1. Dynamical water quality models
 - 1.2. Types of dynamical water quality models
 - 1.3. Levels of model complexity
 - 1.4. Representation of spatial structure
2. Overview of water quality models for the catchment scale
3. Ecohydrological model SWIM – a short description
4. Selected SWIM applications in the Elbe basin
 - 4.1. Case study basin and subbasins

- 4.2. Model calibration and validation
 - 4.2.1. Rhin catchment
 - 4.2.2. Weiße Elster, Unstrut and Saale
- 4.3. Uncertainty analysis
- 4.4. Role of wetlands and riparian zones for water quality modeling
- 4.5. Analysis of trend in water quality using SWIM
- 4.6. Land use and land management scenarios
 - 4.6.1. Rhin
 - 4.6.2. Unstrut
- 5. Conclusions and outlook

Dynamic-Stochastic Models Of River Runoff Generation

49

A. N. Gelfan, *Water Problems Institute of Russian Academy of Sciences, Moscow, Russia*

- 1. Introduction
- 2. Evolution of the Dynamic-Stochastic Models of Runoff Generation and their Application to Flood Frequency Analysis
 - 2.1. Dynamic-Stochastic Models Based on Analytical Approaches
 - 2.2. Dynamic-Stochastic Models Utilizing Monte-Carlo Simulation of Meteorological Inputs
 - 2.3. SHCM-Version of the Dynamic-Stochastic Model of Snowmelt Flood Generation
- 3. Application of Dynamic-Stochastic Models to Long-Term Runoff Forecasting
- 4. Conclusions

Coupled Modeling Water Vapor and Carbon Dioxide Fluxes in the Soil-Vegetation-Atmosphere System

70

A. Olchev, A.N. Severtsov *Institute of Ecology and Evolution Problems of the Russian Academy of Science, Moscow, Russia*

- 1. Introduction
- 2. Modeling H₂O and CO₂ Exchange at a Leaf Scale
 - 2.1. Leaf Photosynthesis
 - 2.2. Leaf Evaporation
 - 2.3. Coupling of Photosynthesis and Stomatal Conductance
- 3. Modeling H₂O and CO₂ Fluxes at an Ecosystem Scale
 - 3.1. Photosynthesis and Transpiration of a Plant Canopy
 - 3.2. Root Water Uptake
 - 3.3. Precipitation Interception by a Plant Canopy
 - 3.4. Water Flow in Soil and Soil Evaporation
 - 3.5. Autotrophic Respiration of Vegetation and Heterotrophic Respiration of Soil
- 4. Conclusion

Mathematical Equations of the Spread of Pollution in Soils

106

F. Stagnitti, *Deakin University, Warrnambool, Australia*
 J.-Y. Parlange, *Cornell University, Ithaca, NY, USA*
 D. A. Barry, *Ecole Polytechnique Federale de Lausanne, Switzerland*
 T. S. Steenhuis, *Cornell University, Ithaca, NY, USA*
 L. Li and D. A. Lockington, *University of Queensland, Australia*
 G. C. Sander, *Loughborough University, Leicestershire, UK*

- 1. Introduction
- 2. Convective-Diffusive Equation
- 3. Effects of Boundary Conditions
- 4. Chemical Reactions
- 5. Nonlinear Adsorption
- 6. Two Species Competition

7. Interaction of Surface Water and Chemical Transport in Soils
8. Column Flow
9. Transient Unsaturated Water and Solute Transport
10. Scale Dependent Solutions
11. Transient Solution Profiles
12. Source Solutions
13. Conclusion

Mathematical Models in Water Sciences**138**

V. B. Zalesny, *Institute of Numerical Mathematics, Russian Academy of Sciences, Moscow, Russia*
 R. Tamsalu, *Estonian Marine Institute, Tallinn, Estonia*

1. Introduction
2. Mathematical Models in Hydrodynamics
 - 2.1. Incompressible Inviscid Fluid
 - 2.2. Compressible Inviscid Fluid
 - 2.3. Viscous Incompressible Fluid
3. Mathematical Models of Flows in Rivers, Lakes, and Coastal Waters
 - 3.1. Rivers
 - 3.2. Lakes
 - 3.3. Coastal Waters and Estuaries
4. Mathematical Models of Circulation in Oceans and Seas
 - 4.1. General Circulation of Seas and Oceans
 - 4.2. Equations of a General Circulation of Seas and Oceans
 - 4.3. Peculiarities of Large-scale Dynamics of Seas and Oceans
 - 4.4. Data Analysis
5. Mathematical Models of Water Waves
 - 5.1. Tidal waves
 - 5.2. Wind waves
 - 5.3. Internal waves
 - 5.4. Tsunami
6. Mathematical Models for Water Resources Management
 - 6.1. Modeling of Water Quality and Ecosystems
 - 6.2. Structure of Water-Ecosystem Models
 - 6.3. Simplified Ecosystem Model
 - 6.4. Adjoint Equation Analysis
7. Conclusion

Mathematical Modeling of the Transport of Pollution in Water**204**

Joachim W. Dippner, *Baltic Sea Research Institute Warnemünde, Seestr. 2, D-18119 Rostock, F.R. Germany*

1. Introduction
2. Phenomenology
3. Experiments
4. A Short Introduction to Turbulence Theory
 - 4.1. Fundamentals
 - 4.2. The Turbulent Closure Problem
 - 4.3. Turbulent Diffusion from Point Sources
 - 4.4. The Spectrum of Turbulence
5. Mathematical Modelling of the Transport of Pollution
 - 5.1. Analytical Solutions
 - 5.1.1. The Advection Equation
 - 5.1.2. The Diffusion Equation
 - 5.1.3. The Reaction Equation
 - 5.1.4. The Advection-Diffusion Equation

- 5.2. Numerical Examples
 - 5.2.1. The Advection Equation
 - 5.2.2. The one-dimensional Diffusion Equation
- 6. An Alternative Approach: Lagrangian Tracer Technique (LTT)
 - 6.1. What is a Tracer?
 - 6.2. Lagrangian versus Eulerian View
 - 6.3. Simulation of Advection with LTT
 - 6.4. Simulation of turbulent mixing with LTT
- 7. Examples

Inventories, Water Storage and Queues

247

N.U. Prabhu, *School of Operations Research and Industrial Engineering, Cornell University, USA*

- 1. Introduction
- 2. Inventory Models
 - 2.1. The (Q, r) Model and the EOQ Formula
 - 2.2. The Newsvendor Problem
 - 2.3. The (s, S) Inventory Model
 - 2.4. A Periodic Review Base Stock Inventory Model
- 3. Models for Water Storage
 - 3.1. Moran's Model for the Finite Dam
 - 3.2. A Continuous Time Model for the Dam
- 4. The Queueing System GI /G /S
 - 4.1. The Queueing System M/M/S; Erlang's Loss Formulas
 - 4.2. The M/G/1 System; The Pollaczek-Khintchine Formula
- 5. Queueing Networks
 - 5.1. Closed Networks
 - 5.2. Open Networks: The Product Formula
 - 5.3. Jackson Networks
 - 5.4. A Closed Network Model for Flexible Manufacturing Systems
 - 5.5. An Open Network Model for Flexible Manufacturing Systems
