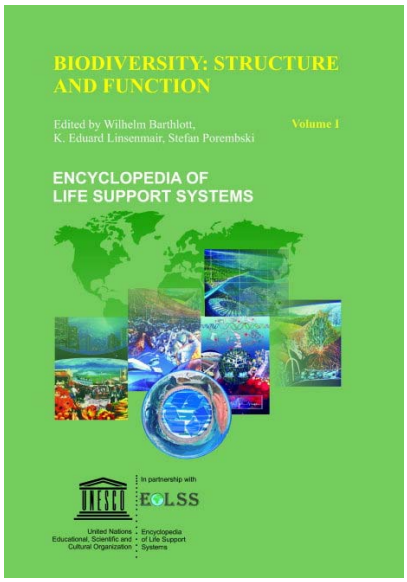
CONTENTS

BIODIVERSITY: STRUCTURE AND FUNCTION



Biodiversity: Structure and Function - Volume 1
No. of Pages: 336
ISBN: 978-1-905839-34-6 (eBook)
ISBN: 978-1-84826-934-7 (Print Volume**)**

Biodiversity: Structure and Function - Volume 2
No. of Pages: 338
ISBN: 978-1-905839-35-3 (eBook)
ISBN: 978-1-84826-935-4 (Print Volume**)**

CONTENTS

VOLUME I

Biodiversity: Structure and Function **1**
Wilhelm Barthlott, *University of Bonn, Botanical Institute, Germany*
K. Eduard Linsenmair, *University of Würzburg, Theodor-Boveri-Institute for Biosciences, Germany*
Stefan Porembski, *University of Rostock, Institute for Biodiversity Research, Germany*

1. The Biosphere at Risk
2. Characterization of Biodiversity
3. Biodiversity and Ecosystem Function
4. Global Change: Magnitude, Distribution, and Characteristics of Biodiversity Dynamics
5. The Spatial and Temporal Dynamics of Biodiversity and Ecosystem Structure
6. The Biodiversity of Marine Ecosystems
7. Perspectives for Biodiversity Utilization, Protection, and Research

Characterization of Biodiversity **31**
Klaus Riede, *Zoologisches Forschungsinstitut und Museum Alexander Koenig, Bonn, Germany*

1. Foundations of classification: from early representations to modern taxonomy
2. Species concepts
   2.1. Morphological species concept
   2.2. Biological species concepts
   2.3. Phylogenetic species concepts
3. Systematics and Taxonomy: Classification and description
4. Nomenclature and Codes
5. Indices of Biodiversity
6. Characterization of genetic diversity
7. Ecological and functional characterization of biodiversity

Biodiversity and Ecosystem Functioning: Basic Principles **68**
Michael Scherer-Lorenzen, *Institute of Plant Sciences, Swiss Federal Institute of Technology Zurich (ETH),Switzerland*

1. Introduction
2. A historical perspective
3. A new paradigm in ecology: the Biodiversity-Ecosystem Function Paradigm
   3.1. Hypotheses
   3.2. Approaches
   3.3. Mechanisms
      3.3.1. Niche complementarity
      3.3.2. Facilitation and mutualism
      3.3.3. Sampling or selection effects
      3.3.4. Distinguishing between complementarity and sampling
      3.3.5. Trait differences are responsible
4. Combining old and new concepts
5. Biodiversity and stability
6. Implications for ecosystem management and conservation

Biodiversity and Ecosystem Functioning: Experimental Systems **89**
Andy Hector, *Institute for Environmental Sciences, University of Zürich, CH-8057, Zürich, Switzerland.*

1. Biodiversity experiments
2. Experiment and observation
3. Experimental design and analysis
4. Interpretation and mechanism
   4.1. Additive partitioning of biodiversity effects
5. Advances in biodiversity experimentation

The Role of Above- and Belowground Linkages in Ecosystem Functioning 98
Gerlinde B. De Deyn, *Department of Multi-trophic Interactions, Netherlands Institute of Ecology, the Netherlands; University of Guelph, Guelph, Ontario, Canada*
Jasper van Ruijven, *Department of Biological Sciences, Imperial College London, UK; Nature Conservation and Plant Ecology group, Wageningen University, the Netherlands*

1. Introduction
2. Effects of plant diversity on higher trophic levels
   2.1. How plant diversity affects the soil food-web
   2.2. Links between plant diversity and aboveground organisms
3. Effects of above- and belowground organisms on plant diversity and ecosystem processes
   3.1. How decomposers affect resource availability and plant diversity
   3.2. Aboveground herbivores and plant diversity: selectivity, disturbance and nutrients
   3.3. Grazing in the dark: the role of belowground herbivores
   3.4. More trophic links: effects of pathogens, mutualists, and predators
4. Interactions between aboveground and belowground organisms
   4.1. Interactions on a single host plant (see Figure 4)
   4.2. Interactions in communities (see Figure 5)
5. Discussion
6. Conclusions

Biodiversity and Ecosystem Functioning of Selected Terrestrial Ecosystems: Grasslands 117
Ansgar Kahmen, *Max Planck Institute for Biochemistry, Jena, Germany*

1. Introduction
2. Evidence from observational studies in natural and semi-natural grasslands
3. Functional redundancy and removal experiments in natural grasslands
4. Diversity and stability
5. Conclusions

Biodiversity and Functioning of Selected Terrestrial Ecosystems: Alpine and Arctic Ecosystems 128
Eva M. Spehn, *Global Mountain Biodiversity Assessment (DIVERSITAS), Institute of Botany, University of Basel, Switzerland.*

1. Alpine and arctic biodiversity
2. Effects of biodiversity on arctic and alpine ecosystems
3. Biodiversity and Global change in arctic and alpine ecosystems
   3.1. Impacts of climate change on mountain biodiversity
   3.2. Impacts of land use changes on mountain biodiversity
4. Future research needs

Biodiversity and Functionality of Aquatic Ecosystems 137
David M. Paterson, *School of Biology, Gatty Marine Laboratory, University of St Andrews, UK.*

1. Why research on aquatic systems has lagged behind
2. The nature of aquatic habitats
   2.1. Fresh water ecosystems

2.2. Marine ecosystems
2.3. Transitional waters
3. Species-specific functional roles
4. Species-combined functionality: Functional groups
5. The problem of functional plasticity
6. Direct and indirect measures of functionality
7. Threats to Biodiversity and ecosystem function
8. Future challenges and directions

Biodiversity and the Functioning of Selected Terrestrial Ecosystems: Agricultural Systems **151**
Andrew Wilby, *Department of Agriculture, University of Reading, UK*
Matt B. Thomas, *Department of Agricultural Sciences and NERC Centre for Population Biology, Imperial College London, UK.*

1. Introduction—biodiversity in agricultural ecosystems
2. Planned diversity and the functioning of agricultural systems
   2.1. Intraspecific diversity
   2.2. Species diversity
   2.3. Habitat and landscape diversity
3. Unplanned diversity and the functioning of agricultural systems
   3.1. Pollination services
   3.2. Soil processes
   3.3. Natural pest control
4. Conclusion

Spatial and Temporal Dimensions of Biodiversity Dynamics **166**
Dethardt Goetze, *Department of Botany, University of Rostock, Germany*
Ursula Karlowski, *Department of Botany, University of Rostock, Germany*
Stefan Porembski, *Department of Botany, University of Rostock, Germany*
Klement Tockner, *Department of Limnology, EAWAG Duebendorf, Switzerland*
Aparna Watve, *Department of Botany, Agharkar Research Institute, India*
Klaus Riede, *Zoological Research Institute and Museum Alexander Koenig, Germany*

1. Introduction
2. Temporal dimensions of biodiversity dynamics
   2.1. Biodiversity dynamics at the population level
      2.1.1. Succession
      2.1.2. Genetic diversification
   2.2. Biodiversity dynamics at the ecosystem level
      2.2.1. Patch dynamics
      2.2.2. Coevolution
   2.3. Consequences for ecosystem functioning
      2.3.1. Biogeochemical cycles and microorganisms
      2.3.2. Productivity, predation and herbivory
      2.3.3. Life-form diversity
      2.3.4. Ecosystem stability
      2.3.5. Ecological non-equilibrium
3. Spatial dimensions of biodiversity dynamics
   3.1. Hierarchical concepts of biodiversity
   3.2. Biodiversity dynamics at the population level
      3.2.1. Island biogeography
      3.2.2. Metapopulation dynamics
   3.3. Biodiversity dynamics at the ecosystem level
      3.3.1. Shifting habitat mosaic
      3.3.2. Patch initials and stepping stones
      3.3.3. Habitat fragmentation

3.3.4. Quantifying biodiversity dynamics on regional scales
3.3.5. Global patterns of biodiversity dynamics
4. Dynamics across geological and ecological scales
4.1. Geological scale
4.2. Ecological scale
4.3. Rapid biodiversity changes
4.4. Forecasting biodiversity changes
5. Outlook

Evolutionary and Genetic Aspects of Biodiversity **209**
J.Albert C. Uy, *Department of Biology, Syracuse University, USA*
G.Theifien, *Department of Genetics, Friedrich Schiller University of Jena, Germany*

1. Introduction
2. Genetic Aspects of Biodiversity
2.1. Genes, Genotypes, and Hereditary Mechanisms
2.2. Genetic diversity
2.2.1. Concepts, Importance
2.2.2. Determining Genetic Diversity
2.3. Population Genetics
3. Evolutionary Aspects of Biodiversity
3.1. Primer to evolution
3.2. Evolution of biodiversity
3.2.1. Genetic divergence and speciation
3.2.2. Cytological divergence and speciation
3.3. Genetics of species formation
3.4. From microevolution to macroevolution
4. Concluding statements on biodiversity, evolution, genetics, and conservation

M**onitoring of Biodiversity** **229**
N. Juergens, *Faculty of Natural Sciences, University of Hamburg, Germany*

1. Introduction
2. Multiple goals of biodiversity monitoring
3. Monitoring of biodiversity in a global change context
4. Scales and levels of biodiversity monitoring
4.1. The Taxonomic Level: *Monitoring of Taxa and their Populations*
4.2. The Structural Level: *Monitoring of Plant Formations and Land Cover by Remote Sensing Techniques*
4.3. The Functional Level*: In-situ-Monitoring of Ecosystems and their Organismic Components*
5. Approaches towards an integrated observation system

Search for Indicators for Biodiversity Assessments **243**
Robert John Scholes, *Council for Scientific and Industrial Research, South Africa*

1. Introduction
2. Measuring biodiversity
3. The attributes of good indicators
4. Types of indicators
4.1. Indicators at the species level
4.2. Indicators at the ecosystem level
4.3. Indicators of Functional Biodiversity
5. Some pragmatic solutions

Data and Information Management and Communication **253**
Walter G. Berendsohn, *Freie Universität Berlin, Botanic Garden and Botanical Museum Berlin-Dahlem, Germany*

1. Introduction
2. Scope of the information domain in biodiversity informatics
   2.1. Primary biodiversity records: biological collection data
   2.2. Collection-level data
   2.3. Nomenclatural data
   2.4. Taxa and concepts
   2.5. Descriptive data
   2.6. Auxiliary data and information services
   2.7. The molecular and the ecosystem level
3. State of the art
   3.1. Data input and management tools
   3.2. The common access system
      3.2.1. History
      3.2.2. Protocol and data specification
      3.2.3. Linking biodiversity databases
   3.3. Tools for display and analysis
4. Some perspectives
5. Conclusion

Index **273**

About EOLSS **279**

VOLUME II

The Value of Biodiversity **1**
Dirk Lanzerath, *German Reference Center for Ethics in the Life Sciences, and Department of Philosophy, University of Bonn, Germany*

1. Introduction
2. Need, benefit and value of biodiversity
   2.1. Arguments in the debate
   2.2. Status of arguments
3. Biodiversity and ethics of nature
   3.1. Exclusive-anthroporelational approaches
   3.2. Trans-anthroporelational approaches
      3.2.1. Theological concepts
      3.2.2. Utilitarian concepts
      3.2.3. Rights view
      3.2.4. Teleological concepts
      3.2.5. The concept of the "reverence for life"
      3.2.6. The concept of the ethics of justice
      3.2.7. The concept of the ethics of interests
      3.2.8. The holistic approach
4. Conclusion

Economic Relevance of Biodiversity **29**
Dirk Lanzerath, *German Reference Center for Ethics in the Life Sciences, and Department of Philosophy, University of Bonn, Germany*

1. Introduction
2. Biodiversity as an economic good
   2.1. Cost-benefit analysis
   2.2. Bioprospecting and biodiversity
   2.3. Agriculture and the diversity of genetic resources
3. Value and access
4. Economic measures and limits of use
5. Conclusion

Ethical Relevance of Biodiversity **40**
Dirk Lanzerath, *German Reference Center for Ethics in the Life Sciences, and Department of Philosophy, University of Bonn, Germany*

1. Introduction
2. Human beings and nature: a complex relationship and its normative implications for the conservation of biodiversity
   2.1. The practical-normative function of the concept of "nature" and the human life-world
   2.2. Responsibility of human beings for and towards nature
3. Rules of preferences and criteria of decision making
   3.1. Human basic needs and benefits
   3.2. Human needs and biodiversity
4. Conclusion

Halting Biodiversity Loss: Fundamentals and Trends of Conservation Science and Action **51**
Pierre L. Ibisch, *Faculty of Forestry, University of Applied Sciences Eberswalde, Germany*
Monika Bertzky, *Institute of Agricultural Economics and Social Sciences, Humboldt University of Berlin, Germany*

1. Culture vs. nature? Biodiversity loss and conservation as facets of human culture and evolution
   1.1. Humans as drivers of biodiversity loss—evolutionary roots of conservation problems
   1.2. From nature protection to biodiversity conservation—origins of conservation, changes of motivation and terminology
2. Dimensions, causes and consequences of biodiversity loss
   2.1. Biodiversity loss and extinction in the evolutionary past
   2.2. The sixth extinction and the Anthropocene
   2.3. Stresses, sources and underlying causes of biodiversity loss
   2.4. Biodiversity loss as a self-enhancing process, the Earth's biological capacity and humankind's ecological footprint
3. Halting biodiversity loss - conservation planning and implementation
   3.1. Targets and visions of biodiversity conservation: conserving structure, patterns or function? Current manifestations or evolution?
   3.2. Strategic conservation planning and implementation
   3.3. How to conserve: ex situ or in situ, protect or manage?

Application of Ecological Knowledge to Habitat Restoration **110**
Hartmut Koehler, *Center for Environmental Research and Technology (UFT), University of Bremen, Germany.*

1. Introduction
2. Historical perspective
3. The theoretical framework
   3.1. The holarchic concept of the biosphere
   3.2. Ecosystem
   3.3. Ecological succession
4. Biodiversity

5. Degradation and habitat destruction
   5.1. Causes and assessment
   5.2. Soil degradation
   5.3. Degradation and the Combat against Desertification
6. Restoration
   6.1. Definitions
   6.2. Targets and indicators
   6.3. Principles
   6.4. Strategy: The Ecosystem Approach of the UNCBD
7. Applications
   7.1. The ReviTec® concept
   7.2. Other approaches
8. Conclusion: What ecological knowledge do we need?

Disturbance Management - Application of Ecological Knowledge to Habitat Restoration 144
A. Jentsch, *Department of Conservation Biology, Helmholtz - Centre for Environmental Research UFZ, Permoserstr. 15, D-04318 Leipzig, and Dept. of Disturbance Ecology and Vegetation Dynamics, Bayreuth University, D-95440 Bayreuth, Germany*

1. Part A: Concepts and Theory - Relating Disturbance Ecology to Restoration
   1.1 The general role of disturbance in restoration
   1.2 Continuous versus discrete processes in ecosystem dynamics
   1.3 Significance of disturbance for ecosystem dynamics
   1.4 Disturbance definition
   1.5 The patch and multi-patch concept
   1.6 Disturbance as a filter in community assembly and a tool in restoration
   1.7 Dynamic equilibrium as a restoration goal
2. Part B: For Practitioners - Application of Ecological Knowledge to Habitat Restoration
   2.1 Effective restoration goals and practices
3. Part C: Case Study - Conservation Action For Substitution of Missing Dynamics
   3.1 Dry acidic grasslands on former military training areas in central Europe
   3.2 Conclusion:

Landscape Dynamics 161
Jacques Baudry, *National Institute for Agronomic Research (INRA), Department "Science for Action and Sustainable Development", Rennes, France*

1. Introduction
   1.1. Scaling issues
      1.1.1. Definitions: scale and level of organization
      1.1.2. The fields of ecological theory related to scaling issues
2. Landscape changes in the wilderness
3. Human driven changes
   3.1. Landscape change at multiple time scales
      3.1.1. A visual approach
      3.1.2. Assessing rates of land use changes
4. Analysis of local landscape changes: the importance of mapping for a spatial analysis
   4.1. Changes in a Mediterranean landscape
   4.2. Changes in a Chinese landscape
   4.3. Conclusion
5. Driving factors in temperate agricultural landscapes
6. Riparian landscapes
7. How do landscape dynamics have to be considered in ecological restoration?
8. Discussion and perspectives
   8.1. Cultural landscape dynamics and biodiversity

8.2. Landscape simulation

Alternative Restoration Strategies in Former Lignite Mining Areas of Eastern Germany **185**
Sabine Tischew, *University of Applied Science (FH) Bernburg, Germany*
A. Kirmer, *University of Applied Science (FH) Bernburg, Germany*
A. Lorenz, *University of Applied Science (FH) Bernburg, Germany*

1. Introduction
2. General site characteristics
3. Investigation methods
   3.1. Colonization processes
   3.2. Woodland development
   3.3. Near-natural restoration methods
   3.4. General methods and data analysis
4. Colonization processes
5. Site dependent and chronological woodland differentiation
6. General Sucessional development—an overview
7. Near-natural restoration methods
   7.1. Case study 1: Development of psammophytic grassland in the Goitzsche mining area
   7.2. Case study 2: Development of semi-dry grassland in the Mücheln mining site
   7.3. Case study 3: Development of mesic grassland in the Roßbach mining site
8. Opportunities and perspectives for integration of natural potentials in reclamation of post-mining landscapes

Afforestation and Reforestation **219**
Michael Bredemeier, *Forest Ecosystems Research Center, University of Göttingen, Göttingen, Germany*
Achim Dohrenbusch, *Institute for Silviculture, University of Göttingen, Germany*

1. Definitions of Terms
2. The particular features of forests among terrestrial ecosystems
3. Ecosystem level effects of afforestation and reforestation
4. Effects on biodiversity
5. Arguments for plantations
6. Political goals of afforestation and reforestation
7. Reforestation problems
8. Afforestation on a global scale
9. Planting techniques
10. Case studies of selected regions and countries
    10.1. China
    10.2. Europe
11. Conclusion

Tropical Forest Restoration Experiences **239**
David Lamb, *School of Integrative Biology, The University of Queensland, Australia*
Ilyas Siddique, *School of Integrative Biology, The University of Queensland, Australia*
Peter D. Erskine, *School of Integrative Biology, The University of Queensland, Australia*
Vera Lex Engel, *Agricultural Sciences Faculty, São Paulo State University (UNESP), Brazil*

1. Introduction
2. Knowledge about Key Processes
3. Using differing approaches under different circumstances
4. Case Studies
   4.1. Tanzania: natural regeneration following a land use policy change
   4.2. Puerto Rico: natural regeneration after a demographic change
   4.3. Australia: direct seeding of rainforest species in the Wet Tropics

4.4. Laos: Nam Ngum watershed direct seeding trial
4.5. Brazil: Direct seeding of early-successional trees in São Paulo
4.6. Vietnam: *Eucalyptus* and *Acacia* monocultures
4.7. Australia: high value species grown in monocultures
4.8. Burma: Mt. Popa Forest Reserve
4.9. Vietnam: Hai Van Mountain Pass, transitional forest
4.10. Brazil: mixed species plantations in São Paulo
4.11. Brazil: mixed plantations on bauxite mine in Central Amazonia
5. Assessing success
6. Restoration at a landscape level
7. Conclusions from tropical restoration experiences to date

Combating Degradation in Arid Systems **260**
Norbert Juergens, *Faculty of Natural Sciences, University of Hamburg, Germany*

1. Introduction
   1.1. Arid Ecosystems
   1.2. Desertification
2. Degradation of natural resources
3. Frame conditions: The importance of scale
4. Defining compartments for feasible approaches
5. Assessment and Monitoring of the problem
6. Approaches to Combating degradation in arid systems
   6.1. Practical steps within the biophysical system
      6.1.1. Water resources
      6.1.2. Conservation of soils and soil fertility
      6.1.3. Conservation and restoration of vegetation
   6.2. The establishment of sustainable resource utilization and restoration
      6.2.1. Information transformation
7. Policy challenges
8. Conclusions
