CONTENTS

Preface **vii**

Celestial mechanics: from antiquity to modern times **1**
Alessandra Celletti, *Dipartimento di Matematica, Università di Roma Tor Vergata, Italy*

1. Introduction
2. From Ptolemy to Copernicus
   2.1. Epicycles and Deferents
   2.2. The Copernican Revolution
   2.3. The Astronomical Revolution
3. Kepler's Laws and Hohmann Transfers
   3.1. Kepler's Laws
   3.2. Hohmann Transfers
   3.3. Delaunay Variables
4. The 3—Body Problem and Gravity Assist
   4.1. Newton's Gravitational Law
   4.2. The Three—Body Problem
   4.3. Sphere of Influence and Patched Conics
   4.4. Gravity Assist
5. Perturbation Theory and the Perihelion of Mercury
   5.1. Perturbation Theory
   5.2. Precession of the Perihelion of Mercury
6. KAM and Nekhoroshev's Theories in Celestial Mechanics
   6.1. KAM Theory and Invariant Surfaces
   6.2. Rotational Tori for the Spin—Orbit Problem
   6.3. Librational Tori for the Spin—Orbit Problem
   6.4. Rotational Tori for a Restricted Three—Body Problem
   6.5. The Planetary Problem
   6.6. Nekhoroshev's Theory and Celestial Mechanics

The Gravitational Two-Body Problem **31**
Daniel J. Scheeres, *Department of Aerospace Engineering Sciences, The University of Colorado, USA*

1. Introduction
2. Body and Mass Distribution Specifications
   2.1. Mass and Center of Mass
   2.2. Relative Orientations
   2.3. Moments of Inertia
   2.4. Body Shapes and Geometry
3. Newtonian Gravitational Attraction
   3.1. Relative Forces
   3.2. Relative Moments
   3.3. Internal Configuration
   3.4. Bounds on the Gravitational Potential
   3.5. Specialized Mass Distributions
4. Equations of Motion
   4.1. Restricted Problem
   4.2. Sphere Restricted Assumption
   4.3. Finite Density Sphere Dynamics
   4.4. Point Mass Translational Dynamics
5. Conservation Principles and Constraints
   5.1. General Integrals of Motion
      5.1.1. Linear Momentum
      5.1.2. Angular Momentum
      5.1.3. Energy
   5.2. Modified Sundman's Inequality

5.3. Minimum Energy Function
6. Constraints on Motion: Escape and Impact
6.1. Hill Stability
6.2. Impact Stability
7. Particular Solutions
7.1. Relative Equilibrium and Minimum Energy Configurations
7.2. Relative Equilibrium Conditions
7.3. Point Mass Bodies
7.4. Finite Sphere Bodies
7.5. Sphere-Restricted
7.6. General Problem
8. Solution of the 2-Point Mass or 2-Sphere Problem
8.1. Equations of Motion
8.2. Classical Integrals of Motion
8.3. Additional Integrals
8.4. Motion in Time
8.5. Special Case of Zero Angular Momentum
8.5.1. Energy Integral and the General Solution
8.5.2. Parabolic Solution for the Zero Angular Momentum Case
8.5.3. Elliptic Solution for the Zero Angular Momentum Case
8.5.4. Hyperbolic Solution for the Zero Angular Momentum Case
9. Conclusion

Classical Hamiltonian Perturbation Theory **76**
Mikhail B. Sevryuk, *V. L. Talroze Institute of Energy Problems of Chemical Physics, Moscow, Russia*

1. Introduction
2. Simplest Persistence Problems
3. Integrable and Partially Integrable Systems
3.1. Action-Angle Variables. Liouville–Arnold Theorem
3.2. Partially Integrable Systems
3.3. Generalized Action-Angle Variables. Nekhoroshev Theorem
4. Eliminating Fast Angles in Nearly Integrable Systems
4.1. Averaging Principle
4.2. Eliminating Fast Angles: the Von Zeipel–Brouwer Method
4.3. Eliminating Fast Angles: the Hori–Deprit Method
5. KAM Theory
5.1. Whitney Smooth Families of Invariant Tori
5.2. Invariant Tori in Nearly Integrable Hamiltonian Systems
5.3. Invariant Tori near Elliptic Equilibria
5.4. Lower Dimensional KAM Theory
5.5. Proof Schemes in KAM Theory
6. Motions in Resonant Zones in Nearly Integrable Systems
6.1. Poincaré's Non-integrability Theorem
6.2. Break-up of Resonant Unperturbed Tori
6.3. Exponential Stability of the Action Variables
6.4. Superexponential Stickiness of Kolmogorov Tori
6.5. Arnold Diffusion
7. Conclusions

The N-Body Problem **126**
Jacques Féjoz, *Université Paris-Dauphine & Observatoire de Paris*

1. Introduction
2. Newton's Equations and their Symmetries
2.1. Reduction of the Problem by Translations and Isometries
3. Some Limit Problems of Particular Importance in Astronomy
3.1. The Planetary Problem

3.2. The Lunar and Well-spaced Problems
3.3. The Plane restricted Three-body Problem
4. Homographic Solutions
5. Periodic Solutions
6. Symmetric Periodic Solutions
7. Global Evolution, Collisions and Singularities
7.1. Sundman's Inequality
7.2. Collisions and Singularities
8. Final Motions in the Three-body Problem
9. Non Integrability
10. Long Term Stability of the Planetary System
10.1. Linstedt and Von Zeipel Series
10.2. Birkhoff Series
10.3. Stability and Instability

The Lagrangian Solutions **168**
Àngel Jorba, *Departament de Matemàtiques i Informàtica, Universitat de Barcelona Gran Via 585,08007 Barcelona, Spain*

1. Introduction
2. Linear Behavior
2.1. The Collinear Points
2.2. The Equilateral Points
3. Nonlinear Dynamics near the Collinear Points
3.1. Reduction to the Center Manifold
3.1.1. The Lie Series Method
3.1.2. The L_1 Point of the Earth-Sun System
3.1.3. The L_2 Point of the Earth-Moon System
3.1.4. The L_3 Point of the Earth-Moon System
3.2. Halo Orbits
3.3. Applications
4. Nonlinear Dynamics near the Triangular Points
4.1. Birkhoff Normal Form
4.1.1. Invariant Tori
4.2. On the Stability
4.2.1. The Dirichlet Theorem
4.2.2. KAM and Nekhoroshev Theory
4.2.3. First Integrals
5. Perturbations
5.1. Periodic Time-dependent Perturbations
5.1.1. The Elliptic Restricted Three-Body Problem
5.1.2. The Bicircular Problem
5.1.3. The Bicircular Coherent Model
5.2. Quasi-periodic Models
5.3. The Effect of Periodic and Quasi-periodic Perturbations
5.4. Other Perturbations
5.5. The Solar System
5.6. Applications to Spacecraft Dynamics

Space Manifold Dynamics **214**
Gerard Gómez Muntané, *Universitat de Barcelona, Spain*
Esther Barrabés Vera, *Universitat de Girona, Spain*

1. Introduction
2. Spacecraft Missions to Libration Point Orbits
2.1. LPO In Lunar and Exploration Missions
2.2. Mission Design around Libration Points
3. The Totality of Bounded Solutions Near Libration Points: The Central Manifold

4. Transfers from the Earth to LPOs and Between LPOs
   4.1. The Transfer from The Earth To A LPO
   4.2. The Trajectory Correction Maneuvers Problem
   4.3. Transfers Between Halo Orbits
   4.4. Transfers between Lissajous Orbits
   4.5. Effective Phases and Eclipse Avoidance
   4.6. Rescue Trajectories from The Moon's Surface
      4.6.1. Stable Manifolds Associated With Halo Orbits
      4.6.2. Stable Manifolds Associated With Lissajous Orbits
5. Station Keeping At A Libration Point Orbit
   5.1. The Floquet Mode Approach
6. Further Applications

The Planetary *N*-Body Problem **256**
Luigi Chierchia, *Dipartimento Di Matematica Università "Roma Tre" Largo S. L. Murialdo 1, I-00146 Roma Italy*

1. The *N*-body Problem: A Continuing Mathematical Challenge
2. The Classical Hamiltonian Structure
   2.1. Newton Equations and their Hamiltonian Version
   2.2. The Linear Momentum Reduction
   2.3. Delaunay Variables
   2.4. Poincaré Variables and the Truncated Secular Dynamics
3. Arnold's Planetary Theorem
   3.1. Arnold's Statements (1963)
   3.2. Proper Degeneracies and the "Fundamental Theorem"
   3.3. Birkhoff Normal Forms
   3.4. The Planar Three-body Case (1963)
   3.5. Secular Degeneracies
   3.6. Herman-Fejóz Proof (2004)
   3.7. Chierchia-Pinzari Proof (2011)
4. Symplectic Reduction of Rotations
   4.1. The Regularized Planetary Symplectic (RPS) Variables
   4.2. Partial Reduction of Rotations
5. Planetary Birkhoff Normal Forms and Torsion
6. Dynamical Consequences
   6.1. Kolmogorov Tori for the Planetary Problem
   6.2. Conley-Zehnder Stable Periodic Orbits

Regularization in Celestial Mechanics **287**
Jörg Waldvogel**,** *Seminar for Applied Mathematics, Swiss Federal Institute of Technology ETH, 8092 Zurich, Switzerland*

1. Introduction
2. Levi-Civita Regularization
   2.1. Time Transformation: Slow-Motion Movie
   2.2. Conformal Squaring
   2.3. Elimination of First Derivatives
3. Kepler Motion
   3.1. The Eccentric Anomaly
   3.2. The Orbit
   3.3. Energy
   3.4. Time
   3.5. Polar Coordinates
   3.6. Angular Momentum
4. Kustaanheimo-Stiefel Regularization
   4.1. Quaternion Algebra
   4.2. The KS Transformation

4.3. Differentiation
4.4. The Inverse Mapping
4.5. Regularization
5. Global Regularization
5.1. The Hamiltonian Formalism
5.2. The Planar Three-Body Problem
5.3. The Restricted Three-Body Problem
6. Outlook

Orbit Determination **315**
Giovanni Federico Gronchi, *Dipartimento di Matematica, Università di Pisa, Largo B. Pontecorvo 5, 56127 Pisa, Italy*

1. Introduction
2. Classical Methods of Preliminary Orbit Determination
2.1. Laplace's Method
2.2. Gauss' Method
3. Least Squares Orbits
3.1. The Least Squares Principle
3.2. Differential Corrections
4. Occurrence of Alternative Solutions
4.1. Charlier's Theory
4.2. Generalization of Charlier's Theory
5. New Challenges with the Modern Surveys
5.1. Very Short Arcs and Attributables
5.2. Identification Problems
5.3. Orbit Identification
5.4. Attribution
6. Linkage
6.1. The Admissible Region Method
6.2. Preliminary Orbits with the Two-Body Integrals

Rotational Dynamics **349**
Vladislav Sidorenko**,** *Keldysh Institute of Applied Mathematics, Moscow, Russia*

1. Introduction. Main assumptions
2. Kinematics of Rotational Motion
2.1. Reference Frames Used in Studies of Rotational Motion
2.2. Euler Angles
2.3. Euler's Kinematical Equations
2.4. Singularities Accompanying the Use of Euler Angles
3. Rotational Dynamics: Euler's Formalism
3.1. The Relation Between Angular Momentum and Angular Velocity
3.2. Tensor of Inertia and Ellipsoid of Inertia
3.3. Euler's Dynamical Equations
4. Rotational Dynamics: Lagrangian Formalism
5. Rotational Dynamics: Hamiltonian Formalism
5.1. Andoyer's Variables
5.2. Hamiltonian of Rotational Motion
5.3. Modified Andoyer's Variables
5.4. "Action-angle" Variables
6. Euler-Poinsot Motion: Torque-free Rotation of the Rigid Body
6.1. Motivation. Equations of Motion
6.2. The Torque-free Rotations in the Triaxial Case
6.3. The Torque-free Rotations in the Axisymmetric Case
7. Torques Applied to Celestial Body
7.1. The Gravity Torque
7.2. The Other Torques Applied to Celestial Bodies

8. Perturbed Euler-Poinsot Motion in the Gravity Field
   8.1. The Rotational Motion of the Body when the Ellipsoid of Inertia is nearly a Sphere
   8.2. Fast Rotations of the Body in Gravity Field
9. Resonant Spin-orbit Coupling
   9.1. Planar Motions
   9.2. Investigation of the Resonant Planar Motions: Various Strategies
   9.3. The Application of Averaging to Reveal the Secular Effects
   9.4. Moon-like Resonant Rotations
   9.5. Mercury-like Resonant Rotations
   9.6. Generalization: "Spatial" Resonant Rotations
   9.7. The Origin of the Resonant Rotational Motions
10. Rotational Dynamics in the Case of the Motion in an Evolving Orbit
   10.1. Cassini's Laws
   10.2. The Evolution of the Orbit as a Source of Chaos in Rotational Dynamics
11. Conclusion

Orbital Resonances In Planetary Systems **380**
Renu Malhotra, *Lunar & Planetary Laboratory, The University of Arizona, Tucson, AZ, USA*

1. Introduction
2. Secular Resonances
   2.1. Kozai-Lidov effect
   2.2. Linear Secular Resonance
   2.3. Sweeping Secular Resonance
3. Mean Motion Resonances
   3.1. Single Resonance Theory
   3.2. Resonance Capture
   3.3. Overlapping Mean Motion Resonances and Chaos
4. Epilogue

Planetary Ring Dynamics **411**
Matthew Hedman**,** *University of Idaho, Moscow ID, U.S.A.*

1. Introduction to Planetary Ring Systems
2. Orbital Perturbations on Individual Ring Particles
   2.1. Orbital Elements
   2.2. Perturbation Equations
   2.3. Ring-particle Responses to Specific Perturbations
      2.3.1. Drag Forces
      2.3.2. Planetary Oblateness
      2.3.3. Inertially-fixed Forces
      2.3.4. Resonant Perturbations
3. Inter-particle Interactions
   3.1. Basic Parameters
   3.2. Equilibrium Particle Distributions
      3.2.1. Homogeneous rings
      3.2.2. Aggregation outside the Roche limit
      3.2.3. Self-gravity wakes
      3.2.4. Overstable Structures and Opaque Rings
4. External Perturbations on Dense Rings
   4.1. Local Perturbations
   4.2. Resonant Perturbations
5. Conclusions
