CONTENTS

VOLUME II

Classical Design Methods for Continuous LTI-Systems **1**
R.T Stefani, *Department of Electrical Engineering, California State University, Long Beach, USA*

1. Introduction

Controller Design in Time-Domain **5**
Unbehauen H, *Control Engineering Division, Department of Electrical Engineering and Information Sciences, Ruhr University Bochum, Germany*

1. Problem formulation
2. Time-domain performance specifications
   2.1. Transient Performance
   2.2. Integral Criteria
   2.3. Calculation of the ISE-Performance Index
3. Optimal controller settings subject to the ISE-criterion
   3.1. Example
   3.2. Optimal Settings for Combinations of PT_n-Plants and Standard Controllers of PID Type
4. Empirical procedures
   4.1. Tuning Rules for Standard Controllers
      4.1.1. Ziegler-Nicols Tuning Rules
      4.1.2. Some Other Useful Tuning Rules
   4.2. Empirical Design by Computer Simulation
5. Mixed time- and frequency-domain design by standard polynomials
6. Concluding Remarks

Design in the Frequency Domain **34**
Stefani R.T, *Department of Electrical Engineering, California State University Long Beach, USA*

1. Introduction
2. Gain and Phase Margins
   2.1. Gain Margin
   2.2. Phase Margin
   2.3. Examples
   2.4. Relationship Between PM and Damping Ratio
3. Types of Compensators
4. Design of PI and Lag Compensators
   4.1. Analysis of PI and Lag Compensators
   4.2. Design Rules for PI and Lag Compensators
   4.3. Example
5. Design of PD Compensators (Realized by Rate Feedback)
   5.1. Analysis of PD Compensations
   5.2. Design Rules for PD (Rate Feedback) Compensators
   5.3. Example
6. Design of Lead Compensators
   6.1. Analysis of Lead Compensators
   6.2. Design Rules for Lead Compensators
   6.3. Example
7. Design of PID Compensators
   7.1. Analysis of PID Compensators
   7.2. Design Rules for PID Compensators
   7.3. Example

8. Design of Lag - Lead Compensators
   8.1. Analysis of Lag-Lead Compensators
   8.2. Design Rules for Lag-Lead Compensation
   8.3. Example

PID Control **58**
Araki M, *Kyoto University, Japan*

1. Introduction
2. Process Models
3. Performance Evaluation of PID Control Systems
4. Action Modes of PID Controllers
5. Design of PID Control Systems
   5.1. Selection of Action Mode
   5.2. Identification of Process Model Parameters
   5.3. Tuning of PID Parameters
6. Advanced Topics
   6.1. Windup of the Integral Element and Anti-Windup Mechanism
   6.2. Two-Degree-of-Freedom PID Controllers
   6.3. Sophisticated Models
   6.4. Other Tuning Methods for PID Parameters

Internal Model Control **80**
Daniel E. Rivera, *Department of Chemical and Materials Engineering, Ira A. Fulton School of Engineering, Arizona State University, Tempe, Arizona 85287-6006,USA*
Melvin E. Flores,*Department of Chemical and Materials Engineering, Ira A. Fulton School of Engineering, Arizona State University, Tempe, Arizona 85287-6006,USA*

1. Introduction
2. The Internal Model Control Structure
   2.1. Closed-loop Transfer Functions for IMC
   2.2. Internal Stability
   2.3. Asymptotic closed-loop behavior (System Type)
   2.4. Performance Measures
3. Internal Model Control Design Procedure
   3.1. Requirements for Physical Realizability on *q*, the IMC Controller
   3.2. Limitations to Perfect Control: the Need for an IMC Design Procedure
   3.3. Statement of the IMC Design Procedure
4. Application of IMC design to Simple Models
   4.1. Example 1a: PI Tuning for A First-Order System
   4.2. Example 1b: PI Tuning for a First-Order System with RHP Zero
   4.3. Example 1c: PI with Filter Tuning for a First-Order System with LHP Zero
   4.4. Example 2: PID Tuning for a Second-Order System with RHP Zero
   4.5. Example 3: PID with Filter Tuning for a second-Order Model with RHP Zero
   4.6. Example 4: Dead-time Compensation for a First-Order with Delay Plant
   4.7. IMC-PID Tuning Rules for Plants with Integrator Dynamics
5. IMC-PID tuning Rules for First-Order with Delay Plants
6. Additional IMC Design Topics

Smith Predictor and its Modifications **109**
Hang C. C,*Department of Electrical Engineering, National University of Singapore, Singapore.*

1. Introduction
2. Controller design
3. Performance comparison

4. Modification for high order systems
5. Modification for rapid load rejection
6. Modifications for open-loop unstable systems

Digital Control Systems **127**
Paraskevopoulos P.N,*National Technical University of Athens, Greece*

1. The Basic Structure of Digital Control Systems
2. Discrete-Time Systems
   2.1. Introduction
   2.2. Analysis of Linear Time-Invariant Discrete-Time Systems
3. Sampled-Data Systems
   3.1. Introduction
   3.2. Description and Analysis of Sampled-Data Systems
      3.2.1. Example 1
      3.2.2. Example 2
   3.3. Analysis of Sampled-Data Systems
4. Stability
   4.1. Definitions and Basic Theorems of Stability
      4.1.1. Introduction
      4.1.2. Stability of Linear, Time-Invariant, Discrete-Time Systems
      4.1.3. Bounded-Input, Bounded-Output Stability
   4.2. Stability Criteria
      4.2.1. The Routh Criterion using the Mobius Transformation
      4.2.2. Example 3
      4.2.3. The Jury Criterion
      4.2.4. Example 4
      4.2.5. Example 5
      4.2.6. Example 6
5. Controllability
   5.1. Example 7
   5.2. Example 8
6. Observability
   6.1. Example 9
7. Loss of Controllability and Observability due to Sampling
   7.1. Example 10
8. Kalman Decomposition

Discrete-Time, Sampled-Data, Digital Control Systems, and Quantization Effects **152**
Paraskevopoulos P.N, *National Technical University of Athens, Greece*

1. Discrete-Time Systems
   1.1. Introduction
   1.2. Properties of Discrete-Time Systems
      1.2.1. Linearity
      1.2.2. Time-Invariant System
      1.2.3. Causality
   1.3. Description of Linear, Time-Invariant, Discrete-Time Systems
      1.3.1. Difference Equations
      1.3.2. Transfer Function
      1.3.3. Impulse Response or Weight Function
      1.3.4. State-Space Equations
   1.4. Analysis of Linear, Time-Invariant, Discrete-Time Systems
      1.4.1. Analysis Based on the Difference Equation
      1.4.2. Analysis Based on the Transfer Function
      1.4.3. Analysis Based on the Impulse Response

1.4.4. Analysis Based on the State Equations
2. Sampled-Data Systems
2.1. Introduction
2.2. D/A and A/D Converters
2.3. Hold Circuits
2.4. Description and Analysis of Sampled-Data Systems
2.4.1. Analysis Based on the State Equations
2.4.2. Analysis Based on H(kT)
2.4.3. Analysis based on H(z)
3. Digital Control Systems
3.1. Introduction
3.2. Comparison between Digital and Continuous-Time Control Systems
4. Quantization Effects
4.1. Introduction
4.2. Truncation and Rounding

Discrete-Time Equivalents to Continuous-Time Systems **176**
Mohammed S. Santina, *Fellow, The Boeing Company, USA*
Allen R. Stubberud, *University of California Irvine, USA*

1. Introduction
2. Design of Discrete-Time Control Systems for Continuous-Time Plants
2.1. Sampling and A/D Conversion
2.2. Reconstruction and D/A Conversion
3. Discrete-Time Equivalents of Continuous-Time Plants
4. Discretizing Continuous-Time Controllers
4.1. Numerical Approximation of Differential Equations
4.1.1. Euler's Forward Method (One Sample)
4.1.2. Euler's Backward Method (One Sample)
4.1.3. Trapezoidal Method (Two Sample)
4.1.4. An Example
4.1.5. Mapping Between S and Z Planes Using Euler's and Tustin's Methods
4.1.6. Frequency Response Approximations
4.1.7. Bilinear Transformation with Frequency Prewarping
4.2. Matching Step and Other Responses
4.3. Pole-Zero Matching
5. Discretization of Continuous-Time State Variable Models
5.1. Discrete-Time Models of Continuous-Time Systems
5.2. Discrete-Time Approximations of Continuous-Time Systems

Design Methods for Digital Controllers, Sample-Rate **217**
Paraskevopoulos P.N,*National Technical University of Athens, Greece*

1. Design Methods for Digital Controllers
1.1. Introduction
1.2. Discrete-Time Controller Design Using Indirect Techniques
1.3. Direct Digital Controller Design via the Root-Locus Method
1.4. Direct Digital Controller Design Based on the Frequency Response
1.4.1. Introduction
1.4.2. Bode Diagrams
1.4.3. Example 1
1.4.4. Nyquist Diagrams
1.5. The PID Controller
1.6. State-Space Design Methods
1.7. Optimal Control
2. Sample Rate

2.1. Introduction
2.2. Example 2

Real-Time Implementation **237**
Ulrich Kiffmeier,*dSPACE GmbH, Technologiepark 25, 33100 Paderborn, Germany.*

1. Introduction
2. A Simple Real-Time System
3. Computational Delay and Jitter
4. Real-Time Integration of Continuous-Time States
5. Implementation on Fixed-Point Processors
6. Implementation on Floating-Point Processors
7. Real-Time Operating Systems
8. Intertask Communication in Multitasking Systems
9. Distributed Real-Time Systems
10. Time Triggered Systems for Safety Critical Applications
11. Development Tools for Real-Time Implementation
